

Homework #1

Instructor: Dr. Zafeirakis Zafeirakopoulos
Assistant: Gizem Süngü

Name: Can Duyar

Student Id: 171044075

Course Policy: Read all the instructions below carefully before you start working on the assignment, and before you make a submission.

- It is not a group homework. Do not share your answers to anyone in any circumstance. Any cheating means at least -100 for both sides.
- Do not take any information from the Internet.
- No late homework will be accepted.
- For any questions about the homework, come to my office hour.
- After the office hour, no questions about the homework by email will be responded.
- Submit your homework (both your latex and pdf files in a zip file) into the course page of Moodle.
- Save your latex, pdf and zip files as "Name_Surname_StudentId".{tex, pdf, zip}.
- The deadline of the homework is 22/04/21 23:55.

Problem 1

(100 points)

Homework 1 considers a Covid-19 dataset which is published on [Github](#). Please download any document type that you prefer of the dataset from the links which are shown in Figure 1. The dataset is updated daily and

Figure 1: The complete dataset links

includes data on confirmed cases, deaths, hospitalizations, testing, and vaccinations as well as other variables of potential interest. The data set has the following basic columns:

- iso_code: Short name of the country
- continent: The continent where the country exists
- location: The country name
- date: The date when the data about various variables are taken.

You are responsible to implement a program which reads the given dataset from the file and computes the data for the following questions. Any programming language that you prefer will be accepted. Putting comments on your functions that you implement is must. Each question must be appended to a file which is called "output{.csv, .txt}". The file contains the first 18 questions listed below. The 18th question will be written in this document.

1. How many countries the dataset has?
2. When is the earliest date data are taken for a country? Which country is it?
3. How many cases are confirmed for each country so far? Print pairwise results of country and total cases.

Table 1: The format of the output for the questions 5, 6, 7, 8, 9, 10, 12, 13.

Country	minimum	maximum	average	variation
value	value	value	value	value

4. How many deaths are confirmed for each country so far? Print pairwise results of country and total deaths.
5. What are the average, minimum, maximum and variation values of the reproduction rates for each country?
6. What are the average, minimum, maximum and variation values of the icu_patients (intensive care unit patients) for each country?
7. What are the average, minimum, maximum and variation values of the hosp_patients (hospital patients) for each country?
8. What are the average, minimum, maximum and variation values of the weekly icu (intensive care unit) admissions for each country?
9. What are the average, minimum, maximum and variation values of the weekly hospital admissions for each country?
10. What are the average, minimum, maximum and variation values of new tests per day for each country?
11. How many tests are conducted in total for each country so far?
12. What are the average, minimum, maximum and variation values of the positive rates of the tests for each country?
13. What are the average, minimum, maximum and variation values of the tests per case for each country?
14. How many people are vaccinated by at least one dose in each country?
15. How many people are vaccinated fully in each country?
16. How many vaccinations are administered in each country so far?
17. List information about population, median age, # of people aged 65 older, # of people aged 70 older, economic performance, death rates due to heart disease, diabetes prevalence, # of female smokers, # of male smokers, handwashing facilities, hospital beds per thousand people, life expectancy and human development index.

Table 2: The format of the output for the question 17

Country	population	median age	# of people aged 65 older
value	value	value	value

18. Summarize all the results that you obtain by the first 17 questions (except question 2).

Table 3: The format of the output for the question 18

Country	q#3	q#4	q#5_min	q#5_max	q#5_avg	q#5_var
value	value	value	value	value	value	value

19. Comment the results based on your observations. Write your opinions about the reasons of increasing infection rates by giving examples from the results. Feel free to explain any situation that you observe. More observations more opportunities will bring you for the second homework.
(**Solution**) (Write your observations here.)

-Hearth disease causes coronavirus deaths:

"There are two countries Sweden and Switzerland which have the same situations in most of the variables. Sweden has higher corona death rates than Switzerland. Sweden has also higher cardiovasc death rate than Switzerland."

-Population causes coronavirus cases:

"There are two countries India and Pakistan which have the same situations in most of the variables. India has higher corona cases than Pakistan. India has also higher population than Pakistan"

-Population causes total deaths are confirmed:

"There are two countries India and Pakistan which have the same situations in most of the variables. India has higher total deaths than Pakistan. India has also higher population than Pakistan"

-Low economic performance causes total deaths are confirmed:

"There are two countries Tunisia and Turkey which have the same situations in most of the variables. Turkey has higher total deaths than Tunisia. Turkey has also lower economic performance than Tunisia"

-Number of smokers(male and female) causes coronavirus cases

"There are two countries France and Italy which have the same situations in most of the variables. France has higher number of smokers than Italy. France has also higher coronavirus cases than Italy"

- Higher number of hospital beds per thousand people prevents coronavirus cases

"There are two countries Germany and France which have the same situations in most of the variables. Germany has higher number of hospital beds per thousand people than France. Germany has also lower coronavirus cases than France"

- Lower handwashing facilities causes coronavirus cases

"There are two countries Egypt and Syria which have the same situations in most of the variables. Egypt has lower handwashing facilities than Syria. Egypt has higher coronavirus cases than Syria"
